-AboutUs page/page layout:

## Introduction

### Purpose

The purpose of this study is to examine software to aid in the assistance of creating a web based system with a large database backend.

### Problem

We've been asked to design a system which will allow uploading of patient preoperative and postoperative long term follow-up EVAR Data. The client has asked that the system be designed with the following specifications in mind:

- The EVAR Data must be Anonymized by the system
- The system must manage EVAR CT Slice Data with proper annotations and endograft characteristics. The data is approximately 1GB in size per patient and is uploaded by the user.
- EVAR CT metadata must be able to be uploaded into the database from a Microsoft Excel file.
- The EVAR CT data in the system must be viewable. Information related to the patient, study, series, or slice information must be available as well as graphical representation of the data.
- Patient, study, and series information must be searchable in the database according to their unique identifiers.
- Reproduce selected, or viewed, data into an Excel file upon request.
- The EVAR Data must be downloadable for image analysis and CFD flow simulations. The results of the image analysis and flow simulations will later be uploaded into the database.
- Paraview, an open-source software, must be integrated with the system in order to view velocity, pressure, and wall shear stress as requested.
- The system must have a workflow integrated to e-mail the appropriate surgeon regarding available anatomical and functional analysis results.

Due to the unique nature of the data, and scope of the project, research was conducted on the basis of finding a flexible file management system for medical study and patient information management. A purposed solution for software to be used as the framework for this project is Caisis. The remainder of this report will discuss the extent at which this software meets the problem specifications.

## Discussion

### Background Information

Caisis is an open source, web based, patient data management system with a focus in cancer research. Despite the focus in cancer research, Caisis was developed as an open source software in order to provide the framework for a system capable of integrating patient information and research data. The software and necessary documentation can be downloaded on their website: <http://www.caisis.org/>

### Features

- Eforms for Data Collection ✓
- Data Workflows ✓
- Data Analysis with support with charting and Exporting to Excel/Access ✓

## Requirements

- Web Server
  - Web Server Windows 2000 or above
  - IIS 6 and above
  - Microsoft .NET Framework 3.5/4.0
- DataBase
  - Microsoft SQL Server 2008+

*A lot of team's technology!*

## Security

Caisis has stated the following in regards to its software security:

"The Caisis security system strictly adheres to the guidelines set forth by HIPAA. Steps have been taken to limit unauthorized access to patient data, or other security and confidentiality breaches. Once logged into the application, users can prevent unapproved access to entire sections of data."

## Interface

## UC1: CustomerService

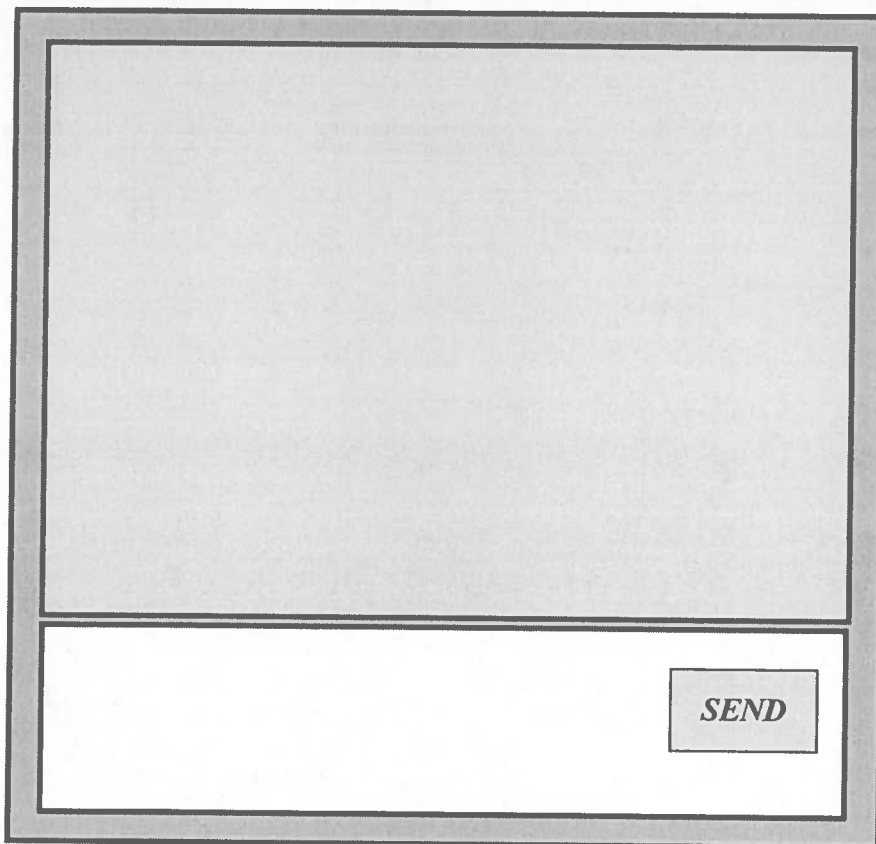

**Actor:** Visitor, Administrator, SuperAdministrator

A visitor may request to start an online chat with customer service by clicking on the Customer Service tab. After they push the tab on the site, a chat window will open.

### Input Form:

A gray rectangular button with a thin black border. The text "Customer Service" is centered within the button in a black, sans-serif font.

### Output Report:

A chat window interface. It consists of a large, empty rectangular area for text input, outlined by a thick gray border. Below this area is a white rectangular box containing a gray button with the word "SEND" in a bold, italicized, black, sans-serif font.

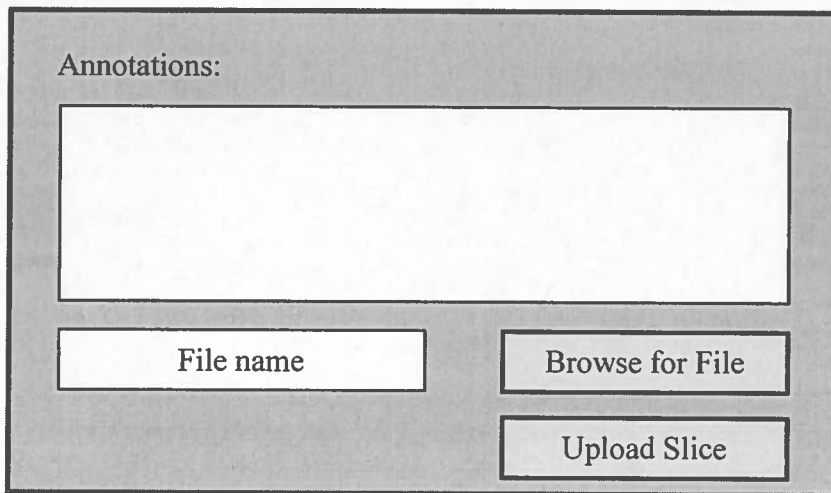

## UC2: UploadSlice

**Actor:** Technician, Doctor, Administrator, SuperAdministrator

Once the actors decide to upload an EVAR CT Slice into the database, they are presented with the following view. To see a list of possible files to upload, the actor will click Browse for File. They are then able to browse a list of files. The file name will show up in the blank. There is also room for annotations regarding the upload. They then press upload slice.

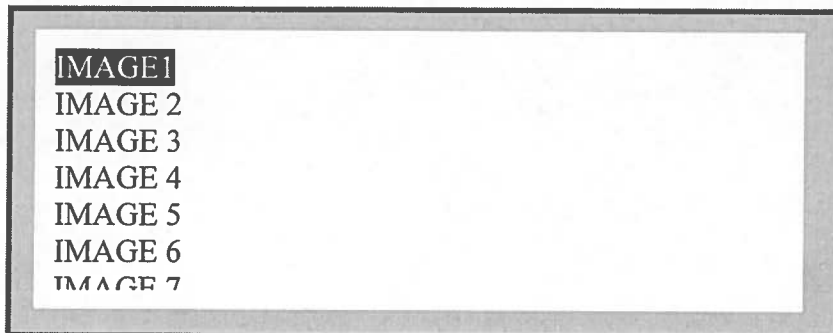

### Input Form:

The input form is a rectangular box with a gray background. It contains the following elements:

- Annotations:** A label at the top left of the form.
- Text Area:** A large, empty rectangular box below the 'Annotations' label for entering text.
- File name:** A label inside a rectangular box at the bottom left.
- Browse for File:** A button labeled 'Browse for File' at the bottom right, positioned above the 'Upload Slice' button.
- Upload Slice:** A button labeled 'Upload Slice' at the bottom right.

### Output Report:

The output report is a rectangular box with a gray background. It contains a list of image names:

- IMAGE1
- IMAGE 2
- IMAGE 3
- IMAGE 4
- IMAGE 5
- IMAGE 6
- IMAGE 7

### UC3: UploadMetaData

**Actor:** Technician, Doctor, Administrator, SuperAdministrator

Once the actors decide to upload Excel file5555 containing metadata, they are presented with the following view. To see a list of possible files to upload, the actor will click Browse for File. They are then able to browse a list of files. The file name will show up in the blank. They then press upload.

**Input Form:**

Hand-drawn diagram of the input form for uploading metadata. The form is a rectangular box containing three input fields: "File name", "Browse for File", and "Upload Data". Above the "File name" field, there is a handwritten note "Date of Surgery" with a line pointing to a small rectangular box.

**Output Report:**

Hand-drawn diagram of the output report for uploading metadata. The report is a rectangular box containing a list of files: FILE 1, FILE 2, FILE 3, FILE 4, FILE 5, FILE 6, and FILE 7.

## UC4: ViewCT

**Actor:** Doctor, Administrator, SuperAdministrator

The actor may use the panel on the left side to select a patient, the study, series, and then slice to view. The slice will then appear on the right. The user can chose to zoom in and out of the image.

### Input Form:

The diagram illustrates the 'View Images' input form. It is divided into two main sections. On the left is a vertical sidebar containing a list of selectable items: Patient 1, Patient 2, Patient 3, Patient 4, Patient 5, Study 1, Series 1, Slice 1, Slice 2, Slice 3, and Slice 4. The right section is the main content area, which has a title 'View Images' at the top. Below the title are two buttons, 'Zoom In' and 'Zoom Out', and a large rectangular area labeled 'Image' for displaying the selected slice.

## Output Report:

View Images

Patient 1  
Patient 2  
Patient 3  
Patient 4  
Patient 5  
Study 1  
Series 1  
Slice 1  
Slice 2  
Slice 3  
Slice 4

Zoom InZoom Out

Image

## UC5: SearchDB

**Actor:** Doctor, Administrator, SuperAdministrator

The actors are able to Search by Patient, Study, or Series. They first select the correct tab from the top. If choosing Search by Patient, the actor can search for the patient by patient ID or origin ID. Then press Search. The available scans for that patient will then show up on the drop box to be selected. They then press Select Scan.

### Input Form:

Search by Patient	Search by Study	Search by Series
Enter Patient ID or Origin ID:		
<input type="text"/>	<input type="button" value="Search for Patient"/>	
Select patient Scan		
<div>Drop Down </div> <div>Scan Option 1</div> <div>Scan Option 2.....</div>	<input type="button" value="Select Scan"/>	

### Output Report:

```

### UC6: ProduceFile

**Actor:** Technician, Doctor, Administrator, SuperAdministrator

The actor can produce an excel file with requested information from the database.

#### Input Form:

The input form is a rectangular box with a gray background. It contains three input elements: a text box labeled "File name" on the left, a "Browse for File" button on the top right, and an "Upload Slice" button on the bottom right.

#### Output Report:

Patient ID	Size	YearsInStudy	Doctor	etc.	etc.	etc
xxxxxxx	xxxxxxx	xxxxxxx	xxxxxxx	xxxxxxx	xxxxxxx	xxxxxxx
xxxxxxx	xxxxxxx	xxxxxxx	xxxxxxx	xxxxxxx	xxxxxxx	xxxxxxx

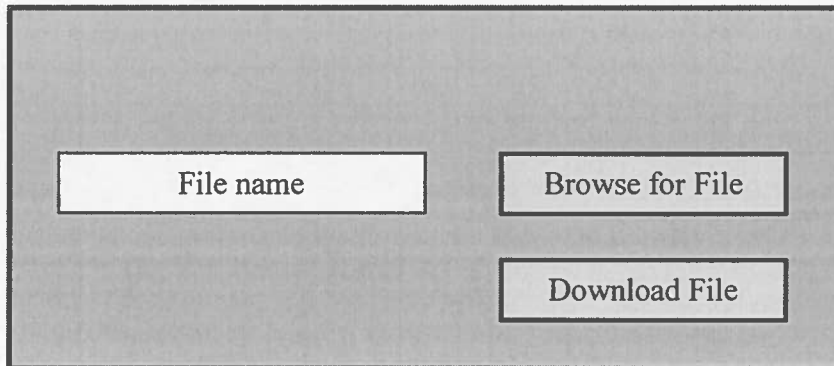

## UC7: DownloadCT

**Actor:** Administrator, SuperAdministrator

The actor can download the image analysis and perform an automatic quantitative image analysis on the 3D reconstruction which will extract 7 measurements.

### Input Form:

The input form is a rectangular box with a dark border. It contains three input fields: a text box labeled 'File name' on the left, and two buttons on the right. The top button is labeled 'Browse for File' and the bottom button is labeled 'Download File'.

### Output Report:

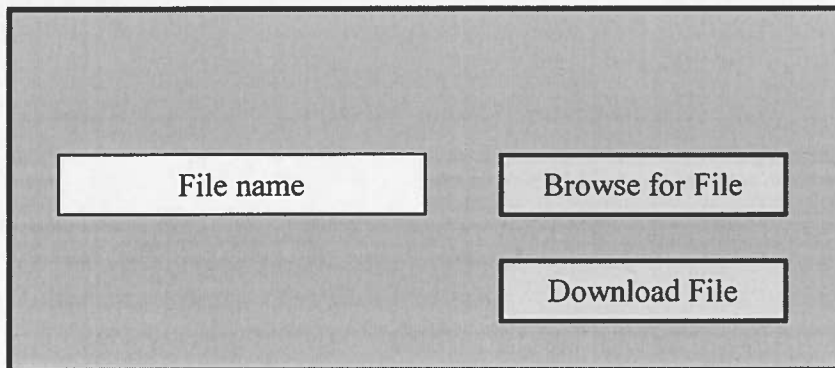

The output report is a rectangular box with a dark border. It contains a single text box with the message 'FILE DOWNLOADED!' in bold, uppercase letters.

### UC8: DownloadData

**Actor:** Administrator, SuperAdministrator

The actor can download CFD flow simulations which will be stored back into the database. CFD simulations provide indicators that help to improve the understanding of the interaction between the aorta, the flow characteristics and the endograft. Simulation files for pressure, velocity, and wall shear stress will be generated during this step

#### Input Form:

The input form is a rectangular box with a gray background. It contains three input fields: a text box labeled 'File name' on the left, and two buttons labeled 'Browse for File' and 'Download File' on the right. The 'Browse for File' button is positioned above the 'Download File' button.

#### Output Report:

The output report is a rectangular box with a gray background. It contains a single message box with the text 'FILE DOWNLOADED!' in bold, black, uppercase letters.

## UC9: ViewWithParaview

**Actor:** Doctor, Administrator, SuperAdministrator

The actor can view .vtu pressure, or velocity, or wall shear stress with Paraview, on open source software

### Input Form:

The input form is a rectangular box with a gray background. It contains a large white rectangular area on the left labeled "File". To the right of this area, there are three stacked rectangular buttons: "File name", "Browse for File", and "View File".

### Output Report:

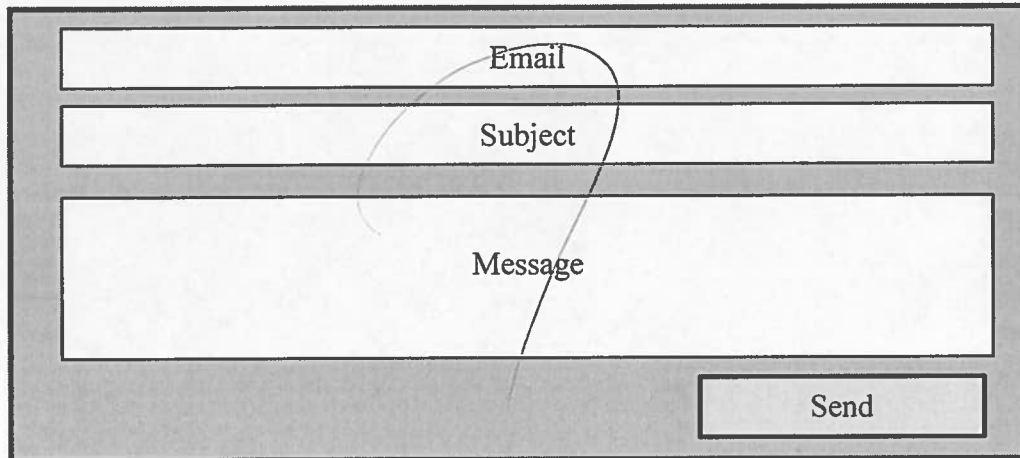

### UC10: TriggerEmail

**Actor:** Administrator, SuperAdministrator

The Actor can trigger an email that can be sent to the appropriate surgeon informing him/her that the anatomical and functional analysis results are ready to be viewed.

#### Input Form:

The input form is a rectangular box with a gray border. It contains three input fields stacked vertically, each with a label to its right: 'Email' for the top field, 'Subject' for the middle field, and 'Message' for the bottom field. A curved line connects the 'Email' label to the 'Subject' field. At the bottom right of the form is a 'Send' button.

#### Output Report:

The output report is a rectangular box with a gray border. It contains a single white rectangular box in the center with the text 'EMAIL SENT!' in bold, black, uppercase letters.

## Chapter I: Introduction to ~~TEAMSOLIS~~

### A. Introduction

The purpose of this project is to create a database for the surgeons to place EVAR information about their patients. The database will automatically anonymize the patient's information to protect their confidential information. Surgeons and other authorized users will be able to upload data, download image analysis, and view specific data. Once a user downloads an image, the user can perform automatic quantitative image analysis on the 3D reconstruction by automatically extracting relevant anatomical data, with 7 measurements.

### B. Research Methodology

There are many software products that are slightly similar to our product, many of which are databases for other medical purposes such as *Endrov*, an Image and data viewer and editor, *InVesalius*, a 3d medical imaging reconstruction software, and many others. This product will have more capabilities as compared to the other software such as anonymizing patient's data, performing automatic quantitative image analysis, and uploading and downloading data.

### C. Report Organization

**Chapter II: Requirements** will be discussing the main problems that could arise during the project. It focuses on the pros and cons of learning new languages versus utilizing languages that the programmers already know. In addition, it will discuss software maintenance that will allow expanding of the system as opposed to creating an entirely new system after several years.

**Chapter III: Educating the User** discusses the phases of software development as well as several possible problems that could arise during implementation of the project. These include software complexity, conformity, and changeability. The large size of the data files is one topic we will discuss.

## Chapter II: Requirements

### A. Problem Statement

Historically, a large portion of software products have been deemed failures, whether it is due to not meeting deadlines, not finishing within the budget, or the product simply not working. A result of this was the creation of the term software engineering, in hopes that it would hold software products to the same standards as other engineering products such as bridges, planes, etc. Economically, the issue of cost must be addressed. One main aspect of cost in developing a software product is time taken to complete. In this case, a particular technology/coding method is what can make a difference in the time taken to develop. On one hand, a team of developers might be familiar with a language that takes a certain amount of time. A new language might be much faster to develop, making the cost less to the client. However, the team has to take into

Please make sure you add subsequent chapters

consideration the time it will take to train on the new language, implement it with a few more issues at first than with the old language, and various other issues. While the new language is easier to code in, it might end up taking more time in the long run and not decrease cost overall. It could also create more issues with maintenance of the code after installation, which prolongs costs over the lifetime of the software. There is more time spent with maintenance than the actual development of code, so in the long run, it might be best to go with the technology that helps create less need for maintenance.

TEAM5QIES plans to address these issues by ensuring to have documents and deliverables finished with plenty of time to look over and change anything needed. One way to avoid historical issues is to make sure everyone has the knowledge needed and to make sure there is a strong leader over everyone. We will ensure that we have both of these. Economically, we will focus on using languages that we are familiar with in order to avoid lengthy learning curves. This will prevent the cost from being high. By avoiding languages we are not familiar with, this should allow us to develop code that will not require heavy post-delivery maintenance.

## **B. Expanding the Borders**

Maintenance, as compared to delivery, typically accounts for a much greater percentage of the software production process. Since many of the software deal with variables that are constantly changing, such as tax percentages, laws, and labor costs, maintenance must be done post-delivery to keep the software up to date. This can involve heavy measures if the code isn't developed in a way that it can be changed easily after installation. Because of this, implementing measures to avoid lengthy maintenance is worthwhile cost-wise. One way TEAM5QIES can ensure this will be done is to utilize constants on variables that could change at one point in time. This will decrease the number of actual changes to be made as well as reduce the chance an error can be made during its implementation.

## **C. Expanding vs. Replacing the System**

Both perfective and adaptive maintenance are essential in the software life cycle. Perfective maintenance is the maintenance done when the client thinks a change can be made to increase effectiveness of the product. This can be anything from a change in code to improve upon response time to a change in website appearance to better appeal to customers. Adaptive maintenance is done due to a change in the environment in which a software product runs. These can be changes because of change in laws, hardware changes, or various other environmental issues.

One important aspect of both types of maintenance is the development of Object Oriented code upon implementation. By using OO from the beginning, maintenance can be done by reusing code if it is implemented correctly. This decreases the time needed to complete the maintenance and thus the cost of the product. Creating code that has the ability to be expanded upon instead of code

that is created without room to have any changes made or grow is a great help to a client who plans on keeping the software long term.

#### **D. Concluding Remarks**

The historical, economic, and maintenance aspects of software engineering are very important to consider at the beginning of development. TEAM5OIES will focus on deadlines, time of production, and creation of code that will be able to be maintained quickly and effectively in order to create a successful software product.

### **Chapter III: Educating the User    The Software Process**

The unified process consists of four distinct phases, inception, elaboration, construction, and transition. Inside each of these phases are various amounts of workflows including requirements, analysis, design, implementation and testing. To ensure that we meet our goals on time and with a working product, TEAM5OIES is following this process software closely by starting with understanding the product domain, working with the client to ensure our proposed solution meets their requirements, and using the object oriented paradigm to complete the construction and testing of our solution. Since we are targeting CMM 3, following the unified process allows us to meet these requirements.

#### **A. Problems with Software Complexity**

One of the major problems with this product will be the complexity of the scans. Not only are these large files, but they are extremely complex data structures. It's potentially difficult to do simple things such as getting an image or date from them and even more difficult to explain this complexity to a non-programmer due to the existence of programs that already do this.

#### **B. Problems with Software Conformity**

As referenced in the section above, these scan files we will be working with are extremely large and complex files. They also include quite a bit of extraneous information for our purposes, however because this system must conform to their existing workflow, we must keep this complexity.

Ideally, the two additional steps of analyzing the measurements and running the flow analysis software would be integrated into the system and run automatically. However, this is an extremely complex operation, and one that is far outside of our current scope of the project.

#### **C. Problems with Software Changeability**

It has already been established that this program is expected to last for many years (as evidenced by the fact that it's for a long-term study). It should be expected that during this duration there will be requests to change the software to better fit into the existing workflow or to conform to a new one. To assist with these inevitable demands, TEAM5OIES will be ensuring that all code is well documented and that it follows all established conventions.

#### **D. Problems with Software Invisibility**

In general, it is extraordinarily difficult to, with any accuracy, visually describe a software program. Of course there are UML diagrams and the like which are useful to visualize certain sections of the program, but there's no good way to visualize

the entire thing at once like a 3-d model of a building could do for an architect. To combat this as effectively as possible, TEAM5OIES will be utilizing the UML constructs and diagrams as often as possible. Our plan is to create a full set of UML diagrams documenting every portion of the system so that, much like a set of blue prints for a building, all but the tiniest of details will be documented.

**E. Concluding Remarks**

While this project will certainly be a challenge, and there are many things we must consider, TEAM5OIES is confident we can succeed. Throughout the design and implementation processes we will be vigilant for issues that could affect the design through any of the above mentioned issues.

#### **Chapter IV: Choosing the Right Team (“Teams” - textbook)**

### UC1 UCCustomerService Description

<b>Name:</b>	<b>UCCustomerService</b>
<b>Actor:</b>	<b>Visitor, Administrator, SuperAdministrator</b>
<b>Description:</b>	<b>This use case describes the process used by Vistor, Administrator, and SuperAdministrator to implement live online support chat with the website's customer service</b>
<b>Successful Completion:</b>	<b>Visitor requests to start a chat by clicking on Customer Service tab</b>  <b>1. <u>Team5OIE System</u> begins a real time chat between Visitor and Customer Service.</b>
<b>Alternative:</b>	<b>Visitor requests to start a chat by clicking on Customer Service tab</b>  <b>1. <u>Team5OIE System</u> is unavailable to begin a real time chat with visitor due to high volume of support needed by other visitors</b> <b>2. <u>Team5OIE System</u> display message to Visitor that chat is unavailable and to check back again later</b>
<b>Pre-Condition:</b>	<b>Visitor requests to start a chat with Customer Service</b>
<b>Post-Condition:</b>	<b>Visitor is able to chat with Customer Service successfully or Unsuccessfully</b>
<b>Assumptions:</b>	<b>There is a Customer Service tab on site, someone is available to chat with the visitor in real time</b>

## UC2 UCUploadSlice Description

<b>Name:</b>	<b>UCUploadSlice</b>
<b>Actor:</b>	<b>Technician, Doctor, Administrator, SuperAdministrator</b>
<b>Description:</b>	<b>This use case describes the process used by Technician to upload EVAR CT slice data to database with the annotations about the endograft characteristics</b>
<b>Successful Completion:</b>	<b>Technician requests to upload EVAR CT slice data</b>  <b>1. <u>Team5OIE System</u> allows successful upload of the EVAR CT slice data complete with the annotations about the endograft characteristics.</b>
<b>Alternative:</b>	<b>Technician requests to upload EVAR CT slice data</b>  <b>1. <u>Team5OIE System</u> is unable to successfully upload the EVAR CT slice data with the annotations about the endograft characteristics.</b>
<b>Pre-Condition:</b>	<b>Technician requests to upload EVAR CT slice data</b>
<b>Post-Condition:</b>	<b>EVAR CT slice data is uploaded to the database successfully or UNSuccessfully</b>
<b>Assumptions:</b>	<b>Technician has data to upload</b>

### UC3 UCUploadMetaData Description

<b>Name:</b>	<b>UCUploadMetaData</b>
<b>Actor:</b>	<b>Technician, Doctor, Administrator, SuperAdministrator</b>
<b>Description:</b>	<b>This use case describes the process used by Technician to upload EVAR CT data metadata from Excel file5555</b>
<b>Successful Completion:</b>	<b>Technician requests to upload metadata from Excel file5555</b>  <b>1. <u>Team5OIE System</u> checks for space in the database for new data</b> <b>2. <u>Team5OIE System</u> prompts for data to be uploaded</b> <b>3. Metadata from file is uploaded to the database and successful message is sent to the Technician</b>
<b>Alternative:</b>	<b>Technician requests to upload metadata from Excel file5555</b>  <b>1. <u>Team5OIE System</u> checks for space in the database for new data</b> <b>2. <u>Movie Company System</u> prompts for data to be uploaded</b> <b>3. If data either ALREADY present or NO MORE ROOM NOT added and UNsuccessful message is sent to the Technician</b>
<b>Pre-Condition:</b>	<b>Technician requests upload metadata from Excel file5555</b>
<b>Post-Condition:</b>	<b>Metadata from Excel file5555 is upload to database successfully or Unsuccessfully</b>
<b>Assumptions:</b>	<b>Technician has data from Excel file5555</b>

#### UC4 UCViewCT Description

<b>Name:</b>	UCViewCT
<b>Actor:</b>	Doctor, Administrator, SuperAdministrator
<b>Description:</b>	This use case describes the process used by Doctor to View the EVAR CT data stored in the database
<b>Successful Completion:</b>	<p>Doctor requests to View CT</p> <ol style="list-style-type: none"><li>1. <u>Team5OIE System</u> displays all the EVAR CT data including the studies, series, and slices of a patient on the left side of the panel and the slice image on the right side of the panel</li><li>2. <u>Team5OIE System</u> allows Doctor to select different display options to view the slice</li></ol>
<b>Alternative:</b>	
<b>Pre-Condition:</b>	Doctor requests to View CT
<b>Post-Condition:</b>	EVAR CT data about a patient is displayed
<b>Assumptions:</b>	Patient is already in the database, data was entered by Technician

## UC5 UCSearch Description

<b>Name:</b>	UCSearchDB
<b>Actor:</b>	Doctor, Administrator, SuperAdministrator
<b>Description:</b>	This use case describes the process used by Doctor to search the database by patient, EVAR CT scan, patient study, and series
<b>Successful Completion:</b>	<p>Doctor requests to search the database</p> <ol style="list-style-type: none"> <li>1. <u>Team5OIE System</u> prompts if Doctor wishes to search by patient, EVAR CT scan, study, or by series</li> <li>2. <u>Team5OIE System</u> prompts for Doctor to enter/select search criteria <ol style="list-style-type: none"> <li>1. if by patient, <u>Team5OIE System</u> prompts for patient ID or origin ID</li> <li>2. if by CT scan, <u>Team5OIE System</u> displays a pulldown menu of all the patient's CT scans</li> <li>3. if by study, <u>Team5OIE System</u> prompts for the study ID, original ID, or study description</li> <li>4. if by series, <u>Team5OIE System</u> prompts for the series ID or series description</li> </ol> </li> </ol>
<b>Alternative:</b>	<p>Doctor requests to search the database</p> <ol style="list-style-type: none"> <li>1. <u>Team5OIE System</u> prompts if Doctor wishes to search by patient, EVAR CT scan, study, or by series</li> <li>2. <u>Team5OIE System</u> prompts for Doctor to enter/select search criteria</li> <li>3. <u>Team5OIE System</u> checks to see if not the criteria entered by the Doctor exists in the database</li> <li>4. If not, then UNsuccessful message is sent to the Doctor</li> </ol>
<b>Pre-Condition:</b>	Doctor requests search the database
<b>Post-Condition:</b>	Search through the database by the patient, CT scan, study, or series is done successfully or UNsuccessfully
<b>Assumptions:</b>	Doctor has information about what they want to search

## UC6 UCProduce Description

<b>Name:</b>	<b>UCProduceFile</b>
<b>Actor:</b>	<b>Technician, Doctor, Administrator, SuperAdministrator</b>
<b>Description:</b>	<b>This use case describes the process used by Technician to produce a new excel file with the requested information from the database5555</b>
<b>Successful Completion:</b>	<b>Technician requests to produce a new excel file with the requested information from database5555</b>  <b>1. <u>Team5OIE System</u> creates and produces a new excel file</b>
<b>Alternative:</b>	
<b>Pre-Condition:</b>	<b>Technician requests to produce a new excel file</b>
<b>Post-Condition:</b>	<b>New excel file is created and produced</b>
<b>Assumptions:</b>	<b>The information requested by Technician is actually in the database</b>

*all upper case*

### UC7 UCDownloadCT Description

<b>Name:</b>	<b>UCDownloadCT</b>
<b>Actor:</b>	<b>Administrator, SuperAdministrator</b>
<b>Description:</b>	<b>This use case describes the process of downloading the CT image data to be analyzed by computational scientists for image analysis</b>
<b>Successful Completion:</b>	<b>1. Data about the CT image is downloaded and ready to be passed off to computational scientists for analysis</b>
<b>Alternative:</b>	
<b>Pre-Condition:</b>	<b>Data to be downloaded is in database</b>
<b>Post-Condition:</b>	<b>The data is downloaded</b>
<b>Assumptions:</b>	

### UC8 UCDownloadData Description

<b>Name:</b>	<b>UCDownloadData</b>
<b>Actor:</b>	<b>Administrator, SuperAdministrator</b>
<b>Description:</b>	<b>This use case describes the process of downloading the CT image data to be analyzed by computational scientists for CFD flow simulations</b>
<b>Successful Completion:</b>	<b>1. Data about the CT image is downloaded and ready to be passed off to computational scientists for analysis</b>
<b>Alternative:</b>	
<b>Pre-Condition:</b>	<b>Data to be downloaded is in database</b>
<b>Post-Condition:</b>	<b>The data is downloaded</b>
<b>Assumptions:</b>	

## UC9 UCViewWithParaview Description

<b>Name:</b>	<b>UCViewWithParaview</b>
<b>Actor:</b>	<b>Doctor, Administrator, SuperAdministrator</b>
<b>Description:</b>	<b>This use case describes the process used by Doctor to view the pressure, velocity, or wall shear stress of a patient's EVAR CT scan</b>
<b>Successful Completion:</b>	<b>Doctor requests to view a patient's EVAR CT scan information</b>  <b>1. <u>Team5OIE System</u> displays requested information</b>
<b>Alternative:</b>	<b>Technician requests to produce a new excel file with the requested information from database5555</b>  <b>1. <u>Team5OIE System</u> does not have information in the database and information is not able to be displayed</b>
<b>Pre-Condition:</b>	<b>The data resides in the <u>Team5OIE System</u> database.</b>
<b>Post-Condition:</b>	<b>The data is displayed</b>
<b>Assumptions:</b>	

## UC10 UCTriggerEmail Description

<b>Name:</b>	<b>UCTriggerEmail</b>
<b>Actor:</b>	<b>Administrator, SuperAdministrator</b>
<b>Description:</b>	<b>This use case describes the process of sending and email to Doctor informing them that the data and it's results are ready to be viewed</b>
<b>Successful Completion:</b>	<b>1. Email is sent to Doctor</b>
<b>Alternative:</b>	<b>1. Information is not ready to be viewed so email is not sent or failed to send to appropriate Doctor</b>
<b>Pre-Condition:</b>	<b>The data has been analyzed and it's results are ready to be view by the appropriate Doctor</b>
<b>Post-Condition:</b>	<b>Appropriate Doctor gets an email that the results are ready</b>
<b>Assumptions:</b>
